Viewing San Jose From Space

Introduction to Remote Sensing Concepts Using Landsat Imagery

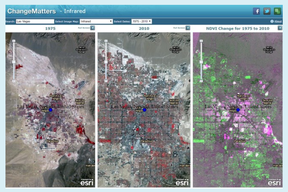
iGETT

igettremotesensing.org

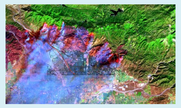
What is remote sensing?

U.S. Geological Survey Definition: Acquiring information about a natural feature or phenomenon, such as the Earth's surface, without actually being in contact with it.

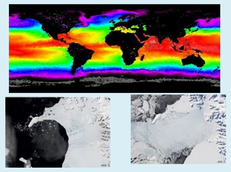
How is remote sensing used?



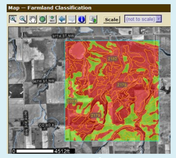
Land use change



Wildfires



Weather & Climate



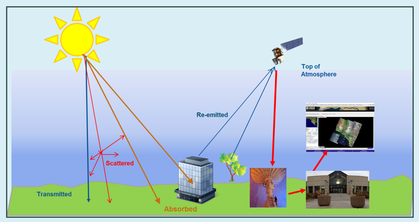
Agriculture

Two Types of Remote Sensing Sensors:

Active Remote Sensor—inputs its own energy source (Lidar)

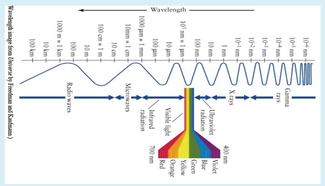
Passive Remote Sensing—uses energy from the Sun (Landsat)

Passive Remote Sensing



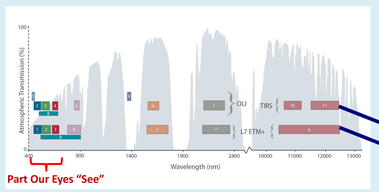
The Sun's energy can be absorbed, reflected or reemitted by objects on Earth's surface. For example, Landsat sensors collect reemitted wavelengths from discrete regions (bands) of the Electromagnetic Spectrum (EMS). Data is transmitted to ground stations, processed and made accessible on the web.

Electromagnetic Spectrum



Wavelength is measured from one crest to the next crest.

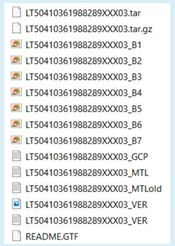
The shorter the wavelength, the greater the frequency and the higher the energy. Our eyes only visualize a small region of the EMS. Sensors can collect data from outside the visual part of the EMS.



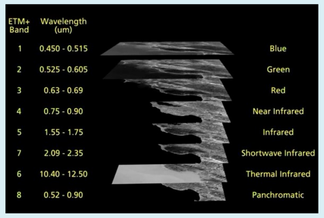
The Earth's atmosphere can block some wavelengths from reaching the satellite sensors so sensors collect in regions of the EMS where there are "atmospheric windows". The gray areas on the graph indicate those windows. Sensor bands are numbered on the graph with:
Landsat 8 (top row) and
Landsat 7 (bottom row) bands.

Based on work supported by the National Science Foundation under grants (DUE 0703185 and 1205089) to the National Council for Geographic Education for the Integrated Remote Sensing Education (iGETT). Any opinions, findings, and conclusion or recommendations expressed in this material are those of the author(s) and do not necessarily reflect the views of the National Science Foundation.

What does Landsat Band Data Look Like?

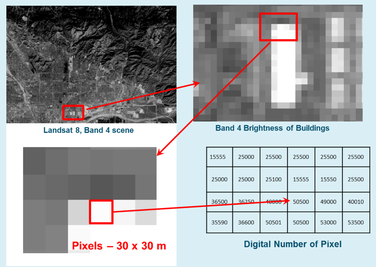


Original and unzipped bands



Landsat imagery is LARGE – Up to 1 GB!

One band's gray scale raster layer

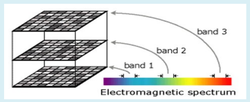


Landsat 8 Band 4 with 30 m pixels

Each band is made up of a grid of equal-sized cells or pixels. Each pixel covers a certain area on the ground and has a digital number (DN) that represents the amount of Electromagnetic energy being reflected. Higher DN values mean more reflectance and brighter pixels. Until assigned a color on a computer monitor, they are displayed in shades of gray (white to black).

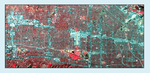
Creating Visualizations of Band Data

Brightness values (DN) from three Bands are combined and assigned to either blue, green or red color guns on a computer monitor creating a Composite Image.

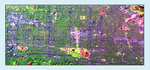


Landsat 8 Band Numbers

True or Natural Color Using Bands 4,3, 2



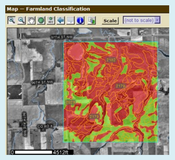
False Color Using Bands 5, 4, 3



False or Pseudo Color Using Bands 7, 6, 4

What Can A Pixel Tell You?

Spectral Signature graphs can be created by plotting brightness (DN) values (or reflectance) versus wavelength of bands for one individual pixel. Signature Graphs are unique for different types of surfaces (soil, vegetation, buildings, etc.). Spectral Signature graphs can also be useful in helping to identify features for land use classification analysis.



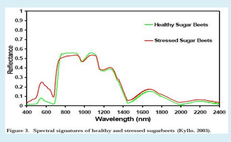


Figure 3. Spectral signatures of healthy and stressed sugarbeets (Kylin. 2003).

Comparison of graphs for pixels of healthy or stressed sugar beets

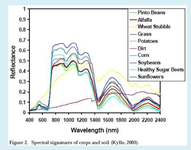

Figure 2. Spectral signatures of crops and soil (Kylin. 2003).

Comparing Spectral Signature graphs of reflectance for different surfaces.

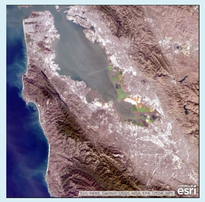
Imagery Resolutions

Spatial – size of area on the ground of one pixel and area of image on the ground
Temporal – how often data (imagery) is acquired for the same location
Radiometric – the ability of a sensor to discriminate and collect very slight differences in emitted or reflected energy (its bit depth)
Spectral – specific wavelengths of spectrum collected by sensors

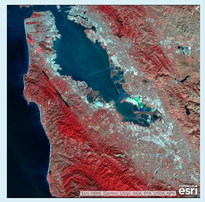
Landsat is generally 30 m resolution with collection on 16 day repeat cycles. Radiometric and Spectral resolutions vary for different Landsat missions. Other imagery sources will have different resolutions.

Esri's Landsat Apps for San Jose

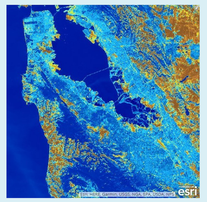
(http:/Esriurl.com/LandsatOnAWS — *Unlocking Earth's Secrets and Landsat Explorer*)



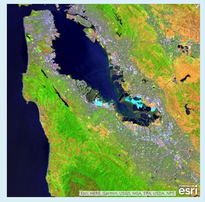
True Color Landsat 8. 30 m Bands 4, 3, 2 + panchromatic 15 m Band 8, November 19, 2022



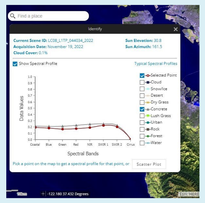
False Color (color infrared) Landsat 8, 30 m, Bands 5, 4, 3, November 19, 2022



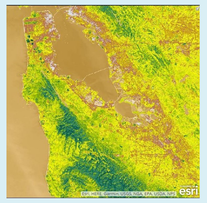
Moisture Index: Normalized Difference Moisture Index (NDMI) (Band5-Band6/Band5+Band6)



Agriculture Highlighted with agriculture in bright green, Band 6, 5, 2— Image on left is from June 1990 and image in middle is June 2020. Note areas where urban development or other changes occurred between those dates. Image on right highlights changes with pink indicating greening loss and green indicating gain.



Two images have Spectral Signature graphs identifying the type of surface feature at the red dot on each image (Landsat 8, Bands 7, 4, 2)



Vegetation Index: Normalized Difference Vegetation Index (NDVI) (Band5-Band4/Band5+Band4)

Can You Identify These Features?

Thanks to New Hampshire View for the idea of a remote sensing poster and to NASA and USGS for graphics. Download this poster from igettremotesening.org and customize it for your state.
